## Problem 1

#### Part i

f(x) is the pdf of any of the  $x_i$ , and since they are *iid*, they all follow one pdf.

The joint pdf is:  $f_{X_1,...,X_n}(x_1,...,x_n) = f(x_1) \times ... \times f(x_n)$  because they are iid.

Since you can multiply the right-hand side in any order, this implies symmetry in regards to the left-hand side.

As a result,  $X_1, ..., X_n$  are exchangeable.

#### Part ii

$$p(y_1, ..., y_n) = \int p(y_1, ..., y_n | \theta) p(\theta) d(\theta)$$

$$= \int \left( \prod_{i=1}^n p(y_i | \theta) \right) p(\theta) d(\theta))$$

$$= \int \left( \prod_{i=1}^n p(y_{\pi_i} | \theta) \right) p(\theta) d(\theta))$$

$$= \int p(y_{\pi_1, ..., y_{\pi_n}} | \theta) p(\theta) d(\theta)$$

$$= p(y_{\pi_1, ..., y_{\pi_n}})$$

## Problem 2

#### Part a

Prior Density:  $p(\theta) = 1$ 

Sampling Distribution:  $p(y|\theta) = \binom{n}{y} \theta^y (1-\theta)^{n-y}$ 

Posterior Density:  $p(\theta|y) \propto p(y|\theta)p(\theta) = \binom{n}{y}\theta^y(1-\theta)^{n-y}$ Posterior Distribution:  $\theta|y \sim Beta(y+1,(n-y)+1)$ 

$$\binom{n}{y} \frac{\Gamma(y+1)\Gamma(n-y+1)}{\Gamma((y+1)+(n-y+1))} = \binom{n}{y} \frac{\Gamma(y+1)\Gamma(n-y+1)}{\Gamma(n+2)}$$

$$= \frac{n!}{y!(n-y)!} \frac{y!(n-y)!}{(n+1)!}$$

$$= \frac{n!}{(n+1)!}$$

$$= \frac{1}{n+1}$$

#### Part b

Prior Distribution:  $\theta \sim Beta(\alpha, \beta)$ 

Sampling Distribution:  $y|\theta \sim Binomial(n,\theta)$ 

Posterior Density:

$$p(\theta|y) = \binom{n}{y} \theta^{y} (1-\theta)^{n-y} \times \frac{\Gamma(\alpha+\beta)}{\Gamma(\alpha)\Gamma(\beta)} \theta^{\alpha-1} (1-\theta)^{\beta-1}$$
$$= \binom{n}{y} \frac{\Gamma(\alpha+\beta)}{\Gamma(\alpha)\Gamma(\beta)} \theta^{y+\alpha-1} (1-\theta)^{n-y+\beta-1}$$
$$\propto Beta(y+\alpha, (n-y)+\beta)$$

Posterior Mean:

$$\frac{y+\alpha}{\alpha+\beta+n} = \frac{y}{n} + \lambda \left(\frac{\alpha}{\alpha+\beta} - \frac{y}{n}\right)$$

$$\frac{y+\alpha}{\alpha+\beta+n} - \frac{y}{n} = \lambda \left(\frac{\alpha}{\alpha+\beta} - \frac{y}{n}\right)$$

$$\frac{ny+n\alpha-\alpha y - \beta y - ny}{(\alpha+\beta+n)n} = \lambda \left(\frac{n\alpha-\alpha y - \beta y}{(\alpha+\beta)n}\right)$$

$$\lambda = \frac{\alpha+\beta}{\alpha+\beta+n}$$

Since  $\lambda$  will always be between 0 and 1 the Posterior Mean will act as a weighted average between our Prior Mean,  $\frac{y}{n}$ , and the data.

#### Part c

Posterior Density:  $\theta|y \sim Beta(y + \alpha, (n - y) + \beta)$ 

Prior Variance ( $\alpha = 1, \beta = 1$ ):  $\frac{1}{12}$ Posterior Variance ( $\alpha = 1, \beta = 1$ ):

$$\frac{(y+1)(n-y+1)}{(n+2)^2(n+3)} = \frac{ny-y^2+y+n-y+1}{(n^2+4n+4)(n+3)}$$
$$= \frac{ny-y^2+y+n-y+1}{n^3+3n^2+4n^2+12n+4n+12}$$
$$= \frac{-y^2+ny+n+1}{n^3+7n^2+16n+12}$$

Now, we can deduce that smaller values of n will maximize this quantity; since  $n \geq y$ , we will set n = y = 1.

Posterior Variance (n = y = 1): 
$$\frac{-y^2 + ny + n + 1}{n^3 + 7n^2 + 16n + 12} = \frac{2}{36} = \frac{1}{18}$$

Thus, the Posterior Variance, which we just minimized, is always less than the Prior Variance of  $\frac{1}{12}$ .

#### Part d

- n = y = 1
- $\alpha = 1$
- $\beta = 10$

Prior Variance:  $\frac{(1)(10)}{(11)^2(12)} = \frac{10}{1452} = 0.0069$ Posterior Variance:  $\frac{(2)(10)}{(12)^2(13)} = \frac{20}{1872} = 0.0107$ 

## Problem 3

#### Part a

Prior Distribution:  $\theta \sim Beta(\alpha, \beta)$ 

Prior Mean: 0.6 Prior Variance: 0.09

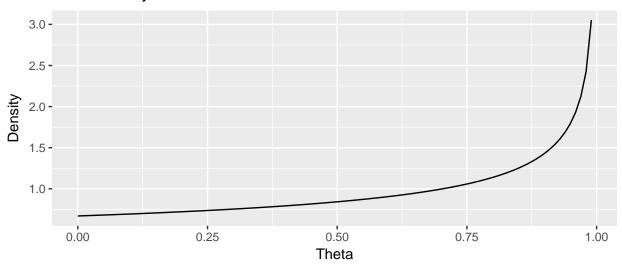

Sampling Distribution:  $y|\theta \sim Binomial(n, \theta)$ 

$$\mu = \frac{\alpha}{\alpha + \beta}$$
$$(\alpha + \beta)\mu = \alpha$$
$$\alpha\mu + \beta\mu = \alpha$$
$$\beta\mu = \alpha - \alpha\mu$$
$$\beta = \alpha(\frac{1}{\mu} - 1)$$

$$\sigma^{2} = \frac{\alpha\beta}{(\alpha+\beta)^{2}(\alpha+\beta+1)}$$
$$\alpha = \left(\frac{1-\mu}{\sigma^{2}} - \frac{1}{\mu}\right)\mu^{2}$$

$$\begin{array}{l} \alpha = 1 \\ \beta = 0.67 \end{array}$$

# **Beta Density**

## Part b

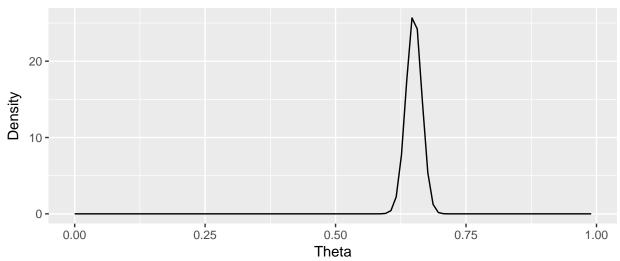

n=1000

y = 650

 $\alpha_{post} = y + \alpha$  $\beta_{post} = (n - y) + \beta$ 

Posterior Mean:  $\mu_{post} = \frac{y+\alpha}{(y+\alpha)+((n-y)+\beta)} = 0.6499$ Posterior Variance:  $\sigma_{post}^2 = \frac{(y+\alpha)((n-y)+\beta)}{((y+\alpha)+((n-y)+\beta))^2((y+\alpha)+((n-y)+\beta)+1)} = 0.0151$ 

# **Beta Density**

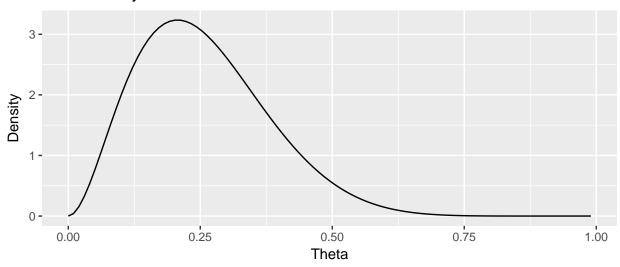

Part c

## First Sensitivity Check

n = 10y = 2

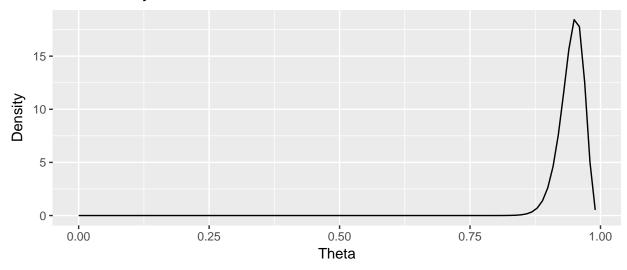

# Beta Density

## Second Sensitivity Check

n = 100y = 95

# **Beta Density**

# Third Sensitivity Check

n = 500y = 250

# Beta Density
